ASIAN CITRUS PSYLLID

Look for small, brown pests that feed on citrus leaves with their body at a 45-degree angle.

> Young psyllids, called nymphs, produce a white, waxy substance.

Inspect new flush

— the smallest,
tender new
leaves sprouting
on your citrus tree
— for the psyllid.
This is a favorite
spot for the pest to
feed and lay eggs.

HLB causes blotchy, uneven yellowing in citrus tree leaves.

Citrus fruit from trees infected with HLB will be bitter and inedible, may not fully ripen, will be misshapen and lose their symmetrical appearance.

Raised, thickened or corky veins on citrus tree leaves are other symptoms of HLB.

Inspect trees for symptoms whenever watering, spraying, pruning or tending trees.

Report pest or disease symptoms to the free statewide hotline: **800.491.1899**.
